**Warning: This information is not intended to diagnose or treat any illness or medical condition and is for educational and historical purposes only.**

The two major Electroherbalism Frequency Lists are the Consolidated Annotated Frequency List (CAFL) and the Non-Consolidated Frequency List (NCFL). The NCFL was compiled first. It consists of various and sundry frequency lists collected over the years. Anecdotal frequencies posted to some of the internet rife listservers have also been collected since the early days of the internet. These were stored in the Electroherbalism archives. In the late 1990's, an effort was made to consolidate all of these frequency lists along with the anecdotal frequencies, some well tested and some not, into a single list. Some basic annotations were added, it was put into tabular form, and the CAFL was born.

The CAFL contains the frequencies from many sources combined into one list. Besides the anecdotal frequencies which can not be found on any other list, it includes early Garvey sets (some which have been converted for use on audio range devices like Rife-Bare machines and EMEMs) as well as more modern frequency sets from researchers such as Don Tunney of Resonant Light Technology and Michael Tigchelaar of TrueRife. A problem with the CAFL is that the sets for even minor maladies can be quite long. However, all frequencies found were included in the hope that at least one in a set would be beneficial.

Since the NCFL is composed of many of the original lists which were combined to produce the CAFL, it can be valuable for viewing concise frequency sets. It does not contain anecdotal frequencies, some of which are the most beneficial since they have been developed most recently. The NCFL does contain frequencies and other information not included in the CAFL, including empirical muscle frequencies, mineral frequencies, original Royal Rife frequencies, Hulda Clark's frequencies converted into audio range, and lists of "codes" for function generators which hide the frequencies from the user.

The frequencies in these lists are not well tested. Some are from pad device sets, some are from homeopathic nosodes, some may be what worked for a single researcher, and some may be mere speculation. Do not stake life or health on them. They are a starting point for research.

There are other frequency lists such as the Crane and Keelynet lists, but these were mostly excluded from the Electroherbalism lists since they are generally composed of different combinations of general frequencies that are typically run often, i.e., 20, 728, 784, 800, 880, 5000, 10000Hz. This is **not** to say these frequencies are not important – they are in general the **most** important frequencies that address the most common pathogens and conditions, so are widely used in many sets, especially general frequency sets.

Many of the frequency sets address the symptoms and only marginally if at all the cause, just like in allopathic medicine. For example, the IBS (irritable bowel syndrome) frequency set may help balance gut bacteria levels and perhaps alleviate some intestinal spasms, but may not include the frequencies for giardia or other parasites, which could

be a factor. The hepatitis C set does not include the frequencies for the blood fluke, schistosoma mansoni, which may be a factor in some if not most cases, according to Hulda Clark's research. Same with chlamydia, herpes 6, and parasites as being potential causative factors in MS.

The CAFL attempts to deal with this problem by providing notes of other frequency sets which may help. Despite filtering, some of the sets contain only general frequencies such as 727/728, 784/787, 464, and 880 when those are the only ones which have been used and found to help. These four frequencies do address a wide range of bacteria, viruses, and fungi. In this respect they may nonetheless help almost any infectious process by removing common pathogens and therefore assisting the immune system since there will be more cells available to concentrate on the "uncommon" pathogens which were not directly addressed in the set. Many people run these four general frequencies in every set regardless of the condition.

Frequencies in the 2000-2200 range are thought to increase the activity of the immune system cells as well as improve blood circulation, so these can also be helpful in any infectious disease, even if they do not address a condition directly. When there is limited time and one will run a session which must include frequencies for many different maladies, some experienced users choose the concise Garvy frequencies from the along with a basic set of 728, 784, 880, and 464. Garvy frequencies are listed separately in the NCFL. When there is plenty of time, one might run the complete set from the CAFL along with any causative factor sets which are listed.

Hulda Clark's frequencies may be useful if a specific pathogen is known. These frequencies are in the 80- 900 KHz range, so cannot be run directly on most Bare-Rife generators or EMEM devices. The most common method used to convert frequencies which are too high to run on an audio range device is to divide by two until the frequency is in range. This method can also be used on Garvy frequencies which are out of range. Pad devices can usually run these higher frequencies directly, which may be of benefit.

Another method used to convert out-of-range frequencies is described by Rife researcher Jeff Sutherland. He asserts that it is much more effective to divide the frequencies by the constant e (2.71828183) raised to the 3rd or 6th power. A list of Hulda Clark frequencies converted into audio range using this method is provided in the NCFL.

Most people run frequencies three minutes each. For a 20 frequency set, this would be an hour long session. Higher powered devices (100W+) may require less time on each frequency. When a frequency is found to be particularly beneficial it may be run for a longer time after assessing detox reaction to ensure it is not too strong.

Scans and sweeps can be effective for determining new frequencies, as well as therapeutic in themselves. Running scans is feasible only with a programmable function generator since manually entering a single frequency every few seconds hundreds of times in a session is not practical. Some of the best ranges for scanning are 300-800 and 2000-2600Hz. Each frequency in a scan is run for 1 to 10 seconds. Any "hits" are noted and after the session these frequencies are run for a full three minutes each. Hits are any frequencies which cause a sensation, such as tingling, pulsing, tickling, itching, etc.

Note that many times (if not most of the time) frequencies which are beneficial may not cause any sensation. And, many times frequencies which are "hits" may cause no apparent benefit. In general, though, frequencies which produce consistent hits over multiple sessions are usually therapeutic, and should be included in sessions until they no longer do. If any frequencies are found to be particularly effective and are not yet listed for a condition, please report them to [turf@mindspring.com](mailto:turf@mindspring.com) for possible inclusion in the CAFL or a Frequency Anecdote file.

Values in the lists are given in Hz unless otherwise noted. There is, in general, nothing special about the order of the frequencies inside frequency sets. This data was compiled from many electronic sources verbatim (except for some annotations) and there is no guarantee of any beneficial effects - most sources of the data were questionable but all frequencies found were included in the hope that at least one in any given set would be helpful.

Sets in the CAFL with a numbered annotation such as \_1 or \_2 are anecdotes and often contain newly discovered frequencies so may be the most effective in some cases. Frequencies marked with an asterisk (\*) in the comments section are thought to be particularly effective. Sets appended with "\_v" are Vega sets, many originally developed by John Garvy of the Son Ridge Health Center as well as his successor, Peter Kapetanacos of the Carolina Health Center ([www.carolinahealthcenter.com](http://www.carolinahealthcenter.com)). Set names appended with "\_TR" are courtesy of TrueRife.com. Sets appended with "\_HC" are scalar harmonics of Hulda Clark frequencies converted to audio range. Sets appended with "\_comp" are comprehensive sets which include most or all of the frequencies for that condition. Sets marked with "secondary" and "tertiary" are those which may be helpful to increase the effects of the main set or to address less common causes of the disorder. "See other" sets, listed in the comment sections, indicate those sets that may be helpful as a compliment. "Use other" sets indicate both alternate nomenclatures for listings as well as additional sets which may be necessary to thoroughly address the problem.

## **The Non-Consolidated Frequency List (NCFL)**

The latest versions of the CAFL and NCFL plus a few articles are also available in a paperback book called *The Electroherbalism Frequency Lists*. [Click here or on the bookcover picture below for details](#). Note that there is nothing in the book which is not also available on this website. The book includes the [CAFL](#), the [NCFL](#), the [CAFL Cross Reference](#), an Introduction to Bioelectronic Therapy Devices, James Bare's "Understanding Our Frequencies Through Harmonics Associations", and "Electrical and Frequency Effects on Pathogens."

See the [Introduction to the Frequency Lists](#) to view notes and explanations of terms used in the CAFL and NCFL.

**The NCFL is available in both PDF and text format. Text is included below, or click on the link to view the PDF version, which is well formatted, unlike the text..**

## **[NCFL v2007-05-16 \(PDF\)](#)**

### **NCFL v2007-05-16**

The Non-Consolidated Frequency List, or NCFL, is a compilation of frequency lists from many different sources. Some sets are excluded from this compilation such as the Keelynet and Crane lists which merely specify for almost every ailment the general frequencies of 728, 784/787, 880, 5000, 10000, 800, 20. These frequencies are important and many people run them with every set as an adjunct.

The NCFL contains some frequencies and other information not included in the CAFL, including empirical muscle frequencies, mineral and metal frequencies, Hulda Clark's original frequencies converted into audio range, frequencies of musical notes, and lists of "codes" for function generators which hide the frequencies from the user.

## **Mid 1990's Rife Researchers' List**

The following was posted by an anonymous contributor to one of the early rife lists and is a compilation of what James Bare, Don Tunney, and Hulda Clark were using in the mid 1990's. The following is the verbatim introduction: "Here is a list that I've compiled. The format is frequency, what it supposedly affects, device, source. If the 'device' field says 'theory' it means that someone said this might work, but no-one has actually said anywhere that they've used it. If the 'device' field says 'theory/440' then I took the frequency from Hulda Clark's book "The Cure For All Diseases" and divided by 440."

\*802 Hz. It was once thought that 802 should not be used if a healthy colon is involved, as it might kill both beneficial and detrimental bacteria, but later research implies that this is not a problem and 800/802 are run often by many people with no harmful effects.

**MORs (Mortal Oscillatory Rates)** - This short list includes Rife's original frequencies that he used during several different time periods of his life as well as 1950s era Crane frequencies and Oxyrife's modern frequencies. Crane frequencies are square wave, Rife's and Oxyrife's are sine wave. For Pre 1935, Rife's frequencies are provided in both frequency (hertz) and wavelength of super regeneration (meters), and then the wavelength converted to frequency.

### Bio-Energetic Frequency Chart

Please note that although most of the frequencies in this list are derived from homeopathic nosodes [vaccines], allergens, sarcodes [organ therapy preparations], or cell salts, some are directly from the specified ailment or substance. However, this distinction appears inconsequential since bio-energetic frequencies should be effective in either case.

Actinobacillus (a potentially pathogenic bacteria normally found in mammals): 773

Actinomyces israelii (a bacterium normally found in the bowel and throat that causes deep, pus-filled holes in tissue): 222, 262, 2154

Adnexitis (swelling of the ovaries or Fallopian tubes): 440, 441, 522, 572, 3343, 3833, 5312

Adenoma, cervical (epithelial tumor of the cervix that can be either benign or malignant): 433  
 Adenovirus (a virus that causes infections in the lungs, stomach, and intestines): 333, 523, 786  
 Aflatoxin (a liver-damaging toxin produced by certain food molds): 344, 510, 943

#### Notes:

1. Frequency codes 14, 16, 17, 20 and 28 affect more microbes and conditions than all other frequencies combined.
2. The second most effective group of frequencies is; 29, 42, 45, 48, 58 and 86. These are mainly used for parasites and amoebae.
3. Frequencies in the range of 11 to 29 produce the most rapid response, usually within 6 hours.
4. Frequencies in the range of 60 to 85 are those that seem to occur naturally in the brain. It is thought that behaviour can be influenced with harmonics of those same frequencies during behaviour of the opposite type. For example, to reduce/eliminate anger, one would apply a freq. of 6.3 Hz (code# 71). See comments for those ranges.
5. Any good quality square-wave generator, such as those recommended for use with the James Bare Rife Device, should be able to output most or all of the Actual Frequencies listed in this document.

### Hulda Clark Frequencies

Hulda Clark frequencies, as published in her books such as *The Cure for all Diseases*, are all above audio range - from 71KHz to above 1MHz. They are specified by

her to be run on a sine wave frequency generator. Plasma tube devices like Rife-Bare or EMEM cannot run these frequencies directly. One way to convert the frequencies for use on an audio range function generator is to repeatedly divide by two until they are in range. Another method, reported by Jeff Sutherland to be more reliable, is called Scalar Harmonics. This is to divide the frequency by e raised to the 3rd or 6th power where e equals the natural logarithm constant, also known as Euler's Constant, 2.71828183. The following list uses e raised to the 6th power (S6) to perform the calculation since all the results are below 10KHz. Clark's frequencies are typically provided as a range (high and low) plus a "use" frequency in between which is specified by her to be the most effective. On pathogen names appended with \_1, \_2, \_3, etc, Clark provides more than one "use" frequency and all of these should be used. Sets annotated with 2nd, 3rd, 4th, etc, indicate she found more than one range for the pathogen. This list is provided on the Electroherbalism website where the S3 scalar harmonic frequencies are also included.

**Tapeworm Frequencies.** Tapeworms are segmented. The first segment is the head, called the scolex. Tapeworms grow by adding a new segment to their body. Tapeworms can have very large bandwidths (range of frequencies), and it varies by the length of the specimen! It is as if each new segment has a unique, and slightly lower, frequency. Do not use a frequency generator to kill tapeworms. If you accidentally kill middle segments instead of working your way up from the bottom, you may conceivably promote dispersion! Use only a zapper. (Editor's Note: By this, Clark means to use only a device producing a pulsed DC square wave (not an AC sine wave) output. It should be fine to use a square wave generator sweeping the lower to upper range)

**The following list was researched by Dr. Toshihiko Yayama in Japan. He used the F-Scan with reagents and patients with known metal poisoning.**

Frequencies have been rounded to the nearest 100 Hz. To test for metals, a DIRP is done from 30,000-60,000 Hz in 100 Hz steps. The mercury frequency has been confirmed by others. These frequencies are intended for research in detecting the presence of metals. They are not intended for use as treatment. Treatment should include chlorella and other materials as needed.

## Cross Reference List of CAFL Frequencies

The CAFL Cross Reference (CAFL XREF) is a compilation of all the conditions in the [Consolidated Annotated Frequency List](#) indexed by frequency. It has limited utility for the most popular frequencies such as 20, 728, 800, 880, 1550, and 10000 since so many conditions are listed, but it can be helpful when running scans and sweeps to possibly indicate frequency sets which may be useful as well as sometimes identify commonality of the causative pathogens of various diseases.

The original cross reference list of the CAFL was produced by [Stone Circle alternatives](#) in the late 1990s. Now, after almost 10 years, a new cross reference list has been produced. Many thanks to Lee George for his help on this project. The CAFL XREF is included in the third edition of the [Electroherbalism Frequency Lists](#), shown at right.

### ***The Electroherbalism Frequency Lists Description:***

The Electroherbalism Frequency Lists, Third Edition, contains frequencies that people use for electrotherapy instruments such as EMEMs, Rife machines, Rife-Bare devices, function generator pad devices, Hulda Clark function generators, Tesla therapy devices, and other complementary bioelectronic instruments. This compilation includes the Consolidated Annotated Frequency List and the Non-Consolidated Frequency List, also known as the CAFL and NCFL, and the newly revised CAFL Cross Reference List (CAFL XREF) as well as the chapters "Introduction to complementary Bioelectronic Therapy Devices," "Electrical and Frequency Effects on Pathogens," and James Bare's "Understanding Our Frequencies Through Harmonic Associations." The Electroherbalism frequency lists are some of the most-used references for frequency researchers the world over.

# The All-Frequencies CAFL (AFCAFL)

The following frequency list is courtesy of Roger Archibald of xxx.xxx.com. He has updated the CAFL with additions based on his research and should be considered experimental. His introduction:

"I wanted to send to you what I have to date and I added in the current Ebola Virus. No there was no testing but I do know that these frequencies will work. There are changes to a lot of the current frequencies listed with many additional frequencies added due to mutation and various environmental changes that were taken into account. I have attached an updated Frequency List for your use, sharing or testing. "

Note that many of the frequencies originally included in the CAFL were contributed by dedicated researchers such as Mr. Archibald and his contribution is much appreciated.

## AFCAFL

All Frequencies in Hz

(NOTE: This is not a substitute for Medical Treatment by a Physician. Always seek Medical Advice from your Doctor.)

### INSTRUCTIONS

1. You may use all the frequencies in the tables or simply test with a given number then if no improvement is seen move to another set.
2. Some individuals experience an increase in symptoms as a result of the die off of microorganisms. It is recommended that subject drink 6-8 additional glasses of water after treatment to aid in detoxification. Drinking water on an empty stomach is highly recommended for more effective detoxification.
3. In some cases, parasites are killed during treatments. These parasites may play host to viruses that then seek a new host. It is not uncommon for individuals to come down with a "COLD" a few days after treatment. To prevent this, it may be wise to include an "ALL BUGS KILL" using a frequency sweep between 100-350 Hz to eliminate these viruses.
4. Serious, Chronic or life threatening conditions such as HIV, CANCER, HEPATITIS C, Etc, should be treated for no less than 15-30 minutes each day, and sometimes one session each morning, and another frequency set in the afternoon, till all traces of the virus is eliminated or it has been confirmed that the condition is in total remission.
5. Maintaining proper blood pH cannot be under emphasized for the body to make the necessary biochemical changes to restore normal function from previous viral damage. (Basic "baking soda" is a good way to alkalize the body.)
6. Using a sweep mode, versus a pulse when setting up these frequencies is important to deal with possible mutations of the virus. Using a pulse for 5 minutes followed by a sweep of the most effective frequency may bring more positive results. Sweeps can be 1-2 Hz up and down.

7. Pain sets are only effective if there is a viral link. Viruses attack the weakest area during infections, as they seek safe harbor where the immune system is at its weakest. This may be in areas of old injury where chronic pain is felt. Thus when one gets the flu, old injuries often flare up.

8. Exposure over 90 minutes per day may result in unknown health consequences or higher detox symptoms such as sore throat, lethargy, tiredness, or symptoms of cold or flu. Drink plenty of water before and after each use to assist the body's detoxification process. Higher frequencies approaching 10,000 or greater should have a more limited exposure time. (3-5 minutes)
